## Controller

WARNING $\begin{aligned} & \text { Do not put SW2 and } 3 \text { in DIPSW/ } 2\end{aligned}$ These settings are only for commercial applications and are not compatible with V94e,V75e and V65e.

## Diagnostic Use of the Controller

1. To display the most recent diagnostic codes press and hold the "On/Off" button for 2 seconds on the MC-91 controller. 2. To enter or exit the maintenance monitor information mode press and hold the down button for 2 seconds and without releasing it
press the ON/OFF button. press the ON/OFF button

To Change the Temperature Scale $\left({ }^{\circ} \mathrm{F} /{ }^{\circ} \mathrm{C}\right.$ With the water heater turned off, press and hold the ON/OFF button until the display changes to the other temperature scale

To Turn Off the Controller Sound (Mute)
To turn the sound off (mute), press and hold both the $\mathbf{\Delta}$ and
thermostat buttons until a "beep" is heard (about 5 seconds). thermostat buttons until a "beep" is heard (about 5 seconds). Locking the Controller
The MC-91-2 controller can be locked or unlocked by pressing the Priority button and the up button together for 5 seconds. A beep will sound confirming that the controller is locked. The display will code if one has been activated. All of the controllers in the system are also locked. To unlock the controller press the Priority button and the up button together for 5 seconds.

## Gas Pressure Setting

| (. WARNING |  |  |  |  |  |  |  |

Commissioning
With all gas appliances in operation at maximum gas rate, the flowing inlet pressure at the incoming test point on the Rinnai water heater should read $4^{\prime \prime}$ W.C. - $10.5^{\prime \prime}$ W.C. on natural gas and 8 " W.C. - 13.5 W.C. on propane gas. If the pressure is lower, the gas supply is inadequate and the unit will not operate
to specification. Check the gas meter regulator and pipework for o sper

| Troubleshooting <br> Important Safety Notes |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| There are a number of (live) tests that are required when fault finding this product. Extreme care should be used at all times to avoid contact with energized components inside the water heater Only trained and qualified service technicians should attempt to repair this product. Before checking for resistance readings, disconnect the power source to the unit and isolate the item from the circuit (unplug it). |  |  |  |  |
| (SV1, SV2, SV3, SV4 and POV) Gas valve and Modulating solenoids: (Set meter above |  |  |  |  |
| Wire color | Voltage | Resistance | Connectior \# |  |
| (Main) Black - Grey | 11~13VDC $11 \sim 13 V D C$ | ${ }_{\text {2 }}^{24 \sim 28 \text { ofms }}$ | ${ }_{\text {D1 }}{ }_{81}$ |  |

| White - White | 11~13VDC | Below 1 ohms | $\left.\right\|_{87} ^{88}$ | B1- |

## Gas Pressure Setting

Ensure gas pressure check under Commissioning has been completed first! The regulator is electronically controlled and
factory pre-set. Under normal circumstances it does not requir adjustment during installation. Make adjustments only if the unit is not operating correctly and all other possible causes for incorrect
operation have been eliminated.

1. Turn OFF the gas supply.
2. Turn OFF the gas supply.
3. Turn OFF the water supply
4. Remove the front panel (four screws).
. Check the gas type using the data plate on the side of the unit. Confirm that the gas type switch is in the correct position
(SW1 in DIPSW2 is ON for natural gas, NG, and OFF for propane gas, LPG.) Figure 1
Remove the screw and attach the manom
point located on the gas control. Figure 2 .
. Turn on the gas supply and the power supply.
5. Flow water through the water heater at the maximum flow rate
obtainable. (At least 3 gallons per minute is recommended. If here is not enough water flowing, the water heater could shut off or sustain damage due to overheating.)
6. Move SW8 in DIPSW1 to ON. Figure 3
7. Push the PC board switch A for one second. Figure 4. 10. Calibrate "Forced Low" combustion using switch A (up) and
switch B (down). switch B (down).
Move SW8 in DIPSW1 to OFF and then back to ON. Figure 6.
8. Push the PC board switch $B$ for one second. Figure 4 . 13. Calibrate "Forced High" combustion using switch A (up) and 4. Move SW8 in DIP
9. Move SW8 in DIPSW1 to OFF. Figure 5 5. Close hot water taps
10. Turn off gas supply and 120 V power supply
11. Remove manometer and re-install screws.
12. Turn on the gas supply and 120 V power supply.
13. Operate the unit and check for gas leaks. 19. Operate the unit and check for gas leaks.
14. Install the front panel using four screws.

Flame Rod:
Place one lead of your meter to the flame rod and the other to ground. With the unit running you should read between $5-150 \mathrm{VAC}$. Set your meter to the $\mu$ amp scale and series your meter in line with the flame the event of low flame circuit remove the flame rod and check for carbon or damage. Heat Exchanger,
Check all thermistors by inserting meter leads into each end of the thermistor plug. Set your meter to the 20 K scale and read resistance. Applying heat to the thermistor bulb should decrease
the resistance. Applying ice to the thermistor bulb should increas the resistance. See below for examples of typical temperatures and Example:

 Frost Protection:
his unit has frost protection heaters mounted at different points to protect the water heater from freezing. All of them should show a

Amp Fuses:
This unit has one inline (10) amp glass fuse. Remove the fuse and check continuity through it. If you have continuity through the fuse
