PC BOARD BUTTONS

Item #	PC Board Switch #	Primary Function	Notes
1	Button 1	Parameter Setting Mode	Refer to section "12.4 Parameter Settings" in Boiler Installation and Operation Manual.
2	Button 2	Deaeration Mode	Refer to section "10. Commissioning" in Boiler Installation and Operation Manual.
3	Button 3	Data Transfer Mode/ Test Combustion Mode/Flushing Mode	This is for transferring PCB data when replacing the PCB. Refer to the instructions included in the replacement parts. Also, this is used for setting the boiler into forced combustion mode and flushing mode.

A (Default)

There are a number of (live) tests required when performing electrical diagnostics on this product. Proceed with caution at all times to avoid contact with energized components inside the boiler. Only trained and qualified service technicians should attempt to repair this product. Before checking for resistance readings, disconnect the power source to the unit and isolate the item from the circuit (unplug it).

Flame Rod

Amp Fuses

This unit has two (2) amp glass fuses located on the PC Board. Remove the fuses and check continuity through it. If you have continuity through each fuse, then it is functioning. Otherwise, the fuse is blown and must be

Table 4. PC Board Buttons

PARAMETER SETTINGS

When the unit is operating

Black-Black

To access the parameter settings, press and hold the SW 1 Button on the PC Board for five seconds (Fig 5). DD-R appears on the display (Fig 6).

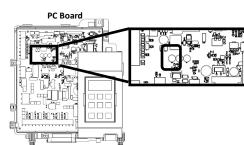

Fig 5. SW 1 Button on PC Board

Press the (Up) or (Down) arrows to select a parameter setting. Then, press the "Select" button (Fig 7).

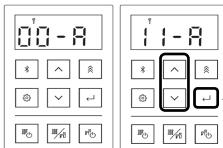

Fig 6. "@@-A" shown in

Fig 7. "Up," "Down" and "Select" Buttons

Press the (Up) or (Down) arrows to change the selection for the setting number (such as II-B or II-b). Then, press the "Select" button (Fig 8).

To exit parameter settings and enter normal operation mode, press and hold the SW1 Button on the PC Board. or more information on parameter settings, refer to the "I-Series"

Plus Condensing Boiler Installation and Operation Manual."

Fig 8. "Up," "Down" and "Select" Buttons

Outdoor Reset Curve: (*) This parameter shows up only when selecting Outdoor Temperature Sensor "In Use" as selecting parameter number DD. For selecting outdoor reset curve, see belo Curve 1: Standard baseboard, high efficiency air handler, cast iron or panel radiators, Curve 2: Staple up radiant., Curve 3: High temperature air handler or undersized baseboard. Curve 4: Low Mass Radiant, Curve 5: High Mass Radiant, Curve 6: Radiators, Curve 7: Custom curve based on customer input. Boost: Available when parameter 🕮 is selected as "A." Boost Mode increases the CH set temperature above the outdoor reset curve target when the boiler has been running on an unusually long call for heat. 30 Minutes 60 Minutes Maximum Outdoor Temperature: Available when parameter DD is set to as "A." Sets maximum outdoor temperature the boiler will fire in CH mode and can prevent boiler from firing in warm outdoor temperatures 77°F (25°C) No Maximum Service Soon: 55 is a time-based service indicator set during installation. 1 Year 2 Years Disabled 0.5 Year Pressure Indication on Controller Panel: The current pressure will cycle on the controller display. If an external pressure gauge is present, it is permissible to change the setting to "No." Yes No De-Rate: This parameter is to limit maximum input when it is necessary. No Setting 1 Setting 2 Indirect Tank: Enables the Indirect Tank Function for Pump 4. On Off Indirect Tank Thermistor/Thermostat Selection: Selects the method of controlling the indirect tank. Thermostat Thermistor Indirect Tank Supply Temperature with Thermistor Control: This parameter is available when parameter number 28 is selected as "A" and parameter number 29 is selected as "b." This selects the supply temperature for the indirect tank when using a thermostat. 180°F (Default) is the maximum supply temperature. The higher the supply temperature to the tank, the quicker the tank will heat up. If this temperature is too high, select other settings as appropriate. Ensure the indirect tank supply temperature is 18°F (10°C) higher than the set point temperature of the tank thermostat. Tank Setting 180°F (82°C) Temperature +18°F (10°C) Indirect Tank Supply Temperature with Thermostat Control: This parameter is available when parameter number 28 is selected as "A." This selects the supply temperature for the indirect tank when using a thermostat. 180°F (Default) is the maximum supply temperature. The higher the supply temperature to the tank, the quicker the tank will heat up. If this temperature i too high, select other settings as appropriate. 180°F (82°C) 160°F (71°C) 140°F (60°C) weed indirect tank temperature drop before firing (with thermistor)

parameter is available when parameter number 28 is selected as "A" and parameter number 29 is selected as "b." This selects the differential temperature between the indirect tank setpoint temperature and rmistor reading. The smaller the value, the more frequently the indirect tank will call for heat. 10.8°F (6°C) 21.6°F (12°C) 16.2°F (9°C) ndirect Tank Operation Option
This parameter is available when parameter number ₴ is selected as "A." When a 3-Way Valve and the boiler pump are to be used for recovering the indirect tank, select "b". Only 120 VAC 3-Way Valves may be used Use 3-Way Valve Indirect Tank Simultaneous Heating-Up
This parameter is available when parameter number 28 is selected as "A" and parameter number 32 is selected as "A." This selects the operation of the indirect tank heating by priority or simultaneously with CH. When "Isinultaneous Heating with Indirect Tank and CH", all pumps may operate simultaneously. When in Simultaneous mode, if the tank does not achieve the Indirect Tank Setpoint Temperature within 60 minutes, it will transition to Indirect Tank Priority. Simultaneous Heating with Indirect Tank and CH Indirect Tank Priority Indirect Tank Priority Time
This parameter is available when parameter number 28 is selected as "A." This selects the time that the indirect tank will maintain priority. After this period of time passes, the indirect tank will cease to be heated and central heating will have priority. If there is still an indirect tank demand after 60 minutes passes of CH priority, indirect tank priority will begin again.

CH Temperature Limitation to Allow Simultaneous Operation with Indirect Tank
This parameter is available when parameter number 28 is selected as "A," parameter number 32 is selected as "A" and parameter number 31 is selected as "b."
This enables CH setting limitation during simultaneous heating. This can prevent unintentionally supplying high temperature supply water to low water heating temperature applications such as floor heating. During simultaneous operation, the heating supply temperature is based on the indirect tank supply temperature. When "NO" is selected, make sure that the CH system and heating application is designed to allow for the high supply temperature. 60 Minutes 40 Minutes 90 Minutes Linked Linked Together Cl pump 1, pump 2, pump 3 and pump 4 This parameter enables linked operation among each CH pumps. For example, when parameter b is selected and T/T 1 is active, both pump 1 and 2 are ON. The T/T wire must be connected to the T/T1 connection. Linked Together CH Pump 1 and Pump 2 This setting is primarily for an application that requires two pumps or more for one zone, such as in use with an injection loop or similar sy Note: Selection d is not available when using an Indirect tank. Linked Operation Between Main Boiler Pump and CH Pump 1: This enables the linked operation between the main boiler pump and CH pump 1. Example: when the main pump is on, pump 1 is also on. Yes (Linked together) Main Pump Runs When the Target Temperature is Reached: This selects the mode of the main pump running when the target setpoint is achieved. This setting is for whether running on intervals to reduce pump operation or continuously running to reduce wait time to re-fire. Intervals are 10 minutes ON and 30 minutes OFF. External Pump Runns When the Temperature is Reached: For selecting the mode of external pump running when the temperature is reached to setting. This is setting for whether stopping external pump running to reduce pump operation timing or operating as same as main pump operation to enable to deliver remained heat in heat exchanger

External Pump Running at Freeze Protection Operation: Selects the mode of external pump running when freeze protection operation. This is setting for whether stopping external pump running to reduce pump operation timing or operating as same as main pump operation to enable to deliver remained heat to the system for keeping system piping from freezing. But it could reduce the temperature inside heat exchanger.

Freeze Protection Level: This selects the freeze protection level. Selecting "b" will prevent the boiler from operating in freeze protection mode more than believed necessary. Does Not Run Does Not Run or Warm Room Temp Normal The Differential Temperature From Extinguishing Fire to Fire Again: How much temperature drop is permitted by the supply water thermistor before the boiler will fire again. When selecting "Quick", the boiler wi Normal Quick CH Setting Temperature Temperature Drop emperature Drop 168°F -182°F (75-82°C) 27°F (15°C) 15°F (8°C) 104°F -166°F (40-74°C) 15°F (8°C) 9°F (5°C) The Time Which Not Allow to Fire Again for CH: For selecting time which not allow to fire again for CH after shutdown burner. This is setting for whether preventing from frequently operating unit or allowing Normal (3 Minutes) Heating Eco Mode On Time
This setting changes the on time of the heating Eco mode. This mode enables greater energy savings by reducing the length of time the boiler is operating. The output temperature of the boiler is slower in this mode.

Air Handler Connection: The setting changes to enable to AH output with linking pump 3. 15 Minutes Air Handler Post Pump Extension Setting: Extending the post Pump timing of pump 3. 15 Seconds 40 Seconds Setting temperature range Setting emperatur Setting nperatur range range **0-10V Input Setting:** Extending the post Pump timing of pump 3. temperature —36°F (20°C) 60 N/A: Manufacture Use Only Manufacture Use Only Manufacture Use Only H ON button used. Boiler fires ba on return water temperature. Thermostat Used Thermostat Usage: Changes the mode between Thermostat Usage and Central Heating Button. System Thermistor Control: Enables system temperature control using the system thermistor on the secondary loop of a cascade system In Use ☐ Cascade: Setting Primary or Secondary unit assignment. Secondary Primary Cascade Units in Standby: Sets which unit in the cascade is the primary unit. 3 4 5 6 RD **Gas Type:** For selecting gas type when conducting gas conversion. Natural Gas Liquid Propane Model: Manufacture Use Only Manufacture use only Manufacture use only Vent Material Used: This selects the venting material used. The boiler is set from the factory to be installed in a PVC venting system. If CPVC, PP, or other approved venting is used, this may be adjusted. See the section on PVC Safety Switch for more information. erial other than PVC: CPVC, PF PVC Altitude Setting: Sets the elevation of the boiler installation.

 Ensure the boiler and CH circuit does not have a freezing condition. 	 If something is wrong on the sensor, replace the sensor.

·	
High/Low Water Pressure	
 If the water pressure is too low, add water into the system until at least 13 PSI is 	

If the output from the PC Board is normal, replace the gas could be added to the property of the property

Check the flame rod and wire for damage

Ensure the flame rod and wire are not wet.

Close the gas shut off valve installed near the boiler.

Ensure the LWCO device is working correctly.

Ensure there are no leaking components in the CH system. If the pressure is too high, adjust the pressure to a maximum of 30 PSI.

Ensure the pressure relief valve and water fill are working correctly.

Ensure the LWCO jumper is connected properly when LWCO is not in use.
 Ensure the output is 24 V AC. If it is not, a transformer is needed.

Check the output from the PC Board to the solenoid gas valve.

If the output from the PC Board is abnormal, replace the PC Board.

See "Electrical Diagnostics" section of this document.
