Table 4. PC Board Buttons PC Board Switch # Primary Function Refer to section "12.4 Parameter Settings" in Boiler Installation and Button 1 Parameter Setting Mode peration Manual. Button 2 eration Mode Refer to section "10. Commissioning" in Boiler Installation and eration Manual. Button 3 Data Transfer Mode/ This is for transferring PCB data when replacing the PCB. Refer to e instructions included in the replacement parts. Also, this is used est Combustion r setting the boiler into forced combustion mode and flushing 1ode/Flushing

		Table 5. Para	ameter Settings	
1	To access the parameter settings, press and hold the SW 1	Parameter #	Setting Description	
1.	Button on the PC Board for five seconds (Fig 5). DD-R			,
	appears on the display (Fig 6).		Outdoor Temperature Sensor: Enables or disables the outdoor temperature sensor.	
	appears on the display (rig o).		Outdoor Reset Curve: (*) This parameter shows up only when selecting Outdoor Temperature Sensor "In Use" as selecting parameter number ID. For selecting outdoor reset curve, see below:	
		01	Curve 1: Standard baseboard, high efficiency air handler, cast iron or panel radiators, Curve 2: Staple up radiant., Curve 3: High temperature air handler or undersized baseboard. Curve 4: Low Mass Radiant, Curve 5: High Mass Radiant, Curve 6: Radiators, Curve 7: Custom curve based on customer input.	
	PC Board			
		02	Boost: Available when parameter D is selected as "A." Boost Mode increases the CH set temperature above the outdoor reset curve target when the boiler has been running on an unusually long call for heat.	3
		03	Maximum Outdoor Temperature: Available when parameter D is set to as "A." Sets maximum outdoor temperature the boiler will fire in CH mode and can prevent boiler from firing in warm outdoor temperatures.	7
		04	Service Soon: 55 is a time-based service indicator set during installation.	
		05	Pressure Indication on Controller Panel: The current pressure will cycle on the controller display. If an external pressure gauge is present, it is permissible to change the setting to "No."	
		06	De-Rate: This parameter is to limit maximum input when it is necessary.	
		28	Indirect Tank: Enables the Indirect Tank Function for Pump 4.	
		29	Indirect Tank Thermistor/Thermostat Selection: Selects the method of controlling the indirect tank.	Т
		-	Indirect Tank Supply Temperature with Thermistor Control: This parameter is available when parameter number 28 is selected as "A" and parameter number 29 is selected as "b." This selects the supply temperature	
			for the indirect tank when using a thermostat. 180°F (Default) is the maximum supply temperature. The higher the supply temperature to the tank, the quicker the tank will heat up. If this temperature is too high,	
			select other settings as appropriate. Ensure the indirect tank supply temperature is 18°F (10°C) higher than the set point temperature of the tank thermostat.	
		30		
	Fig 5. SW 1 Button on PC Board		Indirect Tank Supply Temperature with Thermostat Control: This parameter is available when parameter number 28 is selected as "A" and parameter number 29 is selected as "A." This selects the supply temperature for the indirect tank when using a thermostat. 180°F (Default) is the maximum supply temperature. The higher the supply temperature to the tank, the quicker the tank will heat up. If this temperature is	
			too high select other settings a appropriate.	
`				
Ζ.	Press the (Up) or $(Down)$ arrows to select a	31	Allowed indirect tank temperature drop before firing (with thermistor) This parameter is available when parameter number 28 is selected as "A" and parameter number 29 is selected as "b." This selects the differential temperature between the indirect tank setpoint temperature and	
	parameter setting. Then, press the "Select" button (Fig 7).	1	thermistor reading. The smaller the value, the more frequently the indirect tank will call for heat.	
			Indirect Tank Operation Option	
		32	This parameter is available when parameter number 君 is selected as "A." When a 3-Way Valve and the boiler pump are to be used for recovering the indirect tank, select "b". Only 120 VAC 3-Way Valves may be used	
		20	in this application.	
			Indirect Tank Simultaneous Heating-Up	
			This parameter is available when parameter number 2B is selected as "A" and parameter number 32 is selected as "A." This selects the operation of the indirect tank heating by priority or simultaneously with CH.	
		33	When "indirect Tank Priority" is selected, other pumps except for the indirect tank pump will not operate while the tank is being heated. When "imdirect Tank Priority" is selected, other pumps except for the indirect Tank pump will not operate while the tank is being heated. When "imdirect Tank Priority" is selected.	Indire
			operate simultaneously. When in Simultaneous mode, if the tank does not achieve the Indirect Tank Setpoint Temperature within 60 minutes, it will transition to Indirect Tank Priority.	
		-	Indirect Tank Priority Time	
		34	This parameter is available when parameter number 28 is selected as "A." This selects the time that the indirect tank will maintain priority. After this period of time passes, the indirect tank will cease to be heated	
	→ L V L ⊕ L L Φ L Φ L Φ	רכ	and central heating will have priority. If there is still an indirect tank demand after 60 minutes passes of CH priority, indirect tank priority will begin again.	
			CH Temperature Limitation to Allow Simultaneous Operation with Indirect Tank	
	I I I I I I I I I I I I I I I I I I I		This parameter is available when parameter number 28 is selected as "A," parameter number 32 is selected as "A" and parameter number 33 is selected as "b."	
		35	This enables CH setting limitation during simultaneous heating. This can prevent unintentionally supplying high temperature supply water to low water heating temperature applications such as floor heating. During	
			simultaneous operation, the heating supply temperature is based on the indirect tank supply temperature. When "NO" is selected, make sure that the CH system and heating application is designed to allow for the	
	Fig 6. "DD-R" shown in Fig 7. "Up " "Down" and	-	high supply temperature.	
	Fig 6. "UD-P" shown in Fig 7. "Up," "Down" and display "Select" Buttons		Linked Operation Among Each CH Pumps	
	display Select Buttons		This parameter enables linked operation among each CH pumps. For example, when parameter b is selected and T/T 1 is active, both pump 1 and 2 are ON. The T/T wire must be connected to the T/T1 connection. This setting is primarily for an application that requires two pumps or more for one zone, such as in use with an injection loop or similar system.	
,	Press the 🔺 (Up) or 🗡 (Down) arrows to change the		ins setting is primarily for an application that requires two pumps of more for one zone, such as in use with an injection roup of similar system.	
5.	Press the (up) or (Down) arrows to change the	40		
	selection for the setting number (such as II-R or II-b). Then,			
	press the "Select" button (Fig 8).			
	,			
		Ч	Linked Operation Between Main Boiler Pump and CH Pump 1: This enables the linked operation between the main boiler pump and CH pump 1. Example: when the main pump is on, pump 1 is also on.	
	₽		Main Pump Runs When the Target Temperature is Reached: This selects the mode of the main pump running when the target setpoint is achieved. This setting is for whether running on intervals to reduce pump	-
		42	operation or continuously running to reduce wait time to re-fire. Intervals are 10 minutes ON and 30 minutes OFF.	Co
			External Pump Runs When the Temperature is Reached: For selecting the mode of external pump running when the temperature is reached to setting. This is setting for whether stopping external pump running to	
		43	reduce pump operation timing or operating as same as main pump operation to enable to deliver remained heat in heat exchanger	Ν
			External Pump Running at Freeze Protection Operation: Selects the mode of external pump running when freeze protection operation. This is setting for whether stopping external pump running to reduce pump	
		44	beration timing or operating as same as main pump operation, selects the hidde of external pump raiming when neede protection operating is setting pump raiming to reduce pump operation timing or operating as same as main pump operation to enable to deliver remained heat to the system for keeping system piping from freezing. But it could reduce the temperature inside heat exchanger.	
		45		
		2	Freeze Protection Level: This selects the freeze protection level. Selecting "b" will prevent the boiler from operating in freeze protection mode more than believed necessary.	
			The Differential Temperature From Extinguishing Fire to Fire Again: How much temperature drop is permitted by the supply water thermistor before the boiler will fire again. When selecting "Quick", the boiler will fire again.	
			fire more frequently and achieve more temperature control	
		46	CH Setting Temperature	Tem
	WU WR RU		168°F -182°F (75-82°C)	2
			104°F -166°F (40-74°C)	
			The Time Which Not Allow to Fire Again for CH: For selecting time which not allow to fire again for CH after shutdown burner. This is setting for whether preventing from frequently operating unit or allowing	
	Fig 8. "Up," "Down" and "Select" Buttons	47	frequent operation for quick heating up again.	1
	ng o. op, Down and Sciect Dations		Heating Eco Mode On Time	
		48	This setting changes the on time of the heating Eco mode. This mode enables greater energy savings by reducing the length of time the boiler is operating. The output temperature of the boiler is slower in this mode.	
4.	To exit parameter settings and enter normal operation mode,	50	Air Handler Connection: The setting changes to enable to AH output with linking pump 3.	
	press and hold the SW1 Button on the PC Board.			
		51	Air Handler Post Pump Extension Setting: Extending the post Pump timing of pump 3.	1

DIAGNOSTIC CODES To Display Diagnostic Codes:

simultaneously (Fig 9).

flash one after the other.

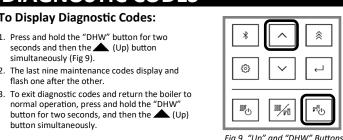

Table 6. Error Reset Venturi Control (150), Gas Valve Adjustment Limit (180), Gas Valve Adjustment(220), High Exhaust Temperature (540), and Freeze Issue (890) can be reset by shutting down power to the bails wer Reset erlock Reset Please call Rinnai Technical Support. Other error can be reset by Indirect Tank "On/Off" button or "Central Heating" (CH) button. Other Reset

Make sure boiler pump activates during operation.

Measure the resistance of the exhaust thermistor.*

Check the exhaust duct, seal, and venting for damage.

If the sensor has been replaced and the error still appears, check the return thermistor

If boiler is used in a hard water area, flush the DHW plate heat exchanger.

Check the exhaust thermistor wiring for damage. Clean the surface of the thermistor.

Important Safety Notes	

There are a number of (live) tests required when performing electrical diagnostics on this product. Proceed with caution at all times to avoid contact with energized components inside the boiler. Only trained and qualified service technicians should attempt to repair this product. Before checking for resistance readings, disconnect the power source to the unit and isolate the item from the circuit (unplug it). Electrical Diagram

Refer to the Wiring Diagram attached to the back of the boiler front cover.

Flame Rod

Place one lead of your meter to the flame rod and the other to the ground. When the unit is attempting to ignite, you should read more than 2 VAC.

Amp Fuses This unit has two (2) amp glass fuses located on the PC Board. Remove the fuses and check continuity through it. If you have continuity through each fuse, then it is functioning.

Otherwise, the fuse is blown and must be replaced.

SECORE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
See parameter D ⁴ in the "Parameter Settings" section for more information. To reset the 55 code, press the Central Heating (CH) button 5 times until 55 disappears. GEORE Boiler Does Not Start Heating With a Heating Demand Present Supply temperature or return temperature inside the boiler may be too hot. Ensure the pump operates properly. If there is a demand immediately after using DHW, wait at least three minutes for operation. GEORE Supply Temperature is Different From the Setting Temperature on the Controller During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. SECORE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
disappears. Boiler Does Not Start Heating With a Heating Demand Present Supply temperature or return temperature inside the boiler may be too hot. Ensure the pump operates properly. If there is a demand immediately after using DHW, wait at least three minutes for operation. DECODE Supply Temperature is Different From the Setting Temperature on the Controller D CODE Supply Temperature is Different From the Setting Temperature will vary dependent on the outdoor temperature. D CODE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
Boiler Does Not Start Heating With a Heating Demand Present Supply temperature or return temperature inside the boiler may be too hot. Ensure the pump operates properly. If there is a demand immediately after using DHW, wait at least three minutes for operation. BCGE Supply Temperature is Different From the Setting Temperature on the Controller During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. BCGE CHE CHE Ensure the parameters are properly set for the installation.
 Supply temperature or return temperature inside the boiler may be too hot. Ensure the pump operates properly. If there is a demand immediately after using DHW, wait at least three minutes for operation. CODE Supply Temperature is Different From the Setting Temperature on the Controller During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. CODE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
Ensure the pump operates properly. If there is a demand immediately after using DHW, wait at least three minutes for operation. Supply Temperature is Different From the Setting Temperature on the Controller During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. CODE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
CODE Supply Temperature is Different From the Setting Temperature on the Controller • During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. • CODE • CH Capacity is Insufficient • Ensure the parameters are properly set for the installation.
CODE Supply Temperature is Different From the Setting Temperature on the Controller • During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. • CODE CH Capacity is Insufficient • Ensure the parameters are properly set for the installation.
During outdoor sensor control, the supply temperature will vary dependent on the outdoor temperature. CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
CODE CH Capacity is Insufficient Ensure the parameters are properly set for the installation.
Ensure the parameters are properly set for the installation.
EEEE Fan Even With No Demand
• The boiler may start or operate the pump for freeze protection operation.

258 Condensate Pump (Accessory)

Freeze Protection Thermistor

353 Supply Thermistor

Return Thermistor

Indirect Thermistor

Exhaust Thermistor

393 Outdoor Thermistor

Pressure Sensor

•

Replace if necessary.

 Replace if necessary. High/Low Water Pressure

443 Low Water Cut-Off (LWCO)

528 Solenoid Valve Circuit

Boiler will operate for 60 seconds. Confirm wire connections and harnesses are good.

Check sensor wiring for damage. Measure the resistance of the sensor.

Measure the resistance of the sensor Check the return thermis Replace if necessary.

Check sensor wiring for damage. Measure the resistance of the sensor.

Check sensor wiring for damage.

Check sensor wiring for damage. Clean the surface of the sensor. Measure the resistance of the sensor. Check the return thermistor.

Check sensor wiring for damage.
 Measure the resistance of the sensor.

 Check sensor wiring for damage. Measure the voltage of the sensor.

Check sensor wiring for damage. Clean the surface of the sensor.

• Ensure the condensate reservoir is empty and condensate pump is operational.

Check if the indirect thermostat is not used at the setting for thermistor usage

If the water pressure is too low, add water into the system until at least 13 PSI is observed

Measure resistance of sensor and replace sensor, if necessary.

• Ensure that parameter number DD is set to the appropriate position.

observed.
Ensure there are no leaking components in the CH system.
If the pressure is too high, adjust the pressure to a maximum of 30 PSI.
Ensure the pressure relief valve and water fill are working correctly.

Ensure the LWCO jumper is connected properly when LWCO is not in use.
 Ensure the output is 24 V AC. If it is not, a transformer is needed.

Check the output from the PC Board to the solenoid gas valve. If the output from the PC Board is abnormal, replace the PC Board.

• If the output from the PC Board is normal, replace the gas control.

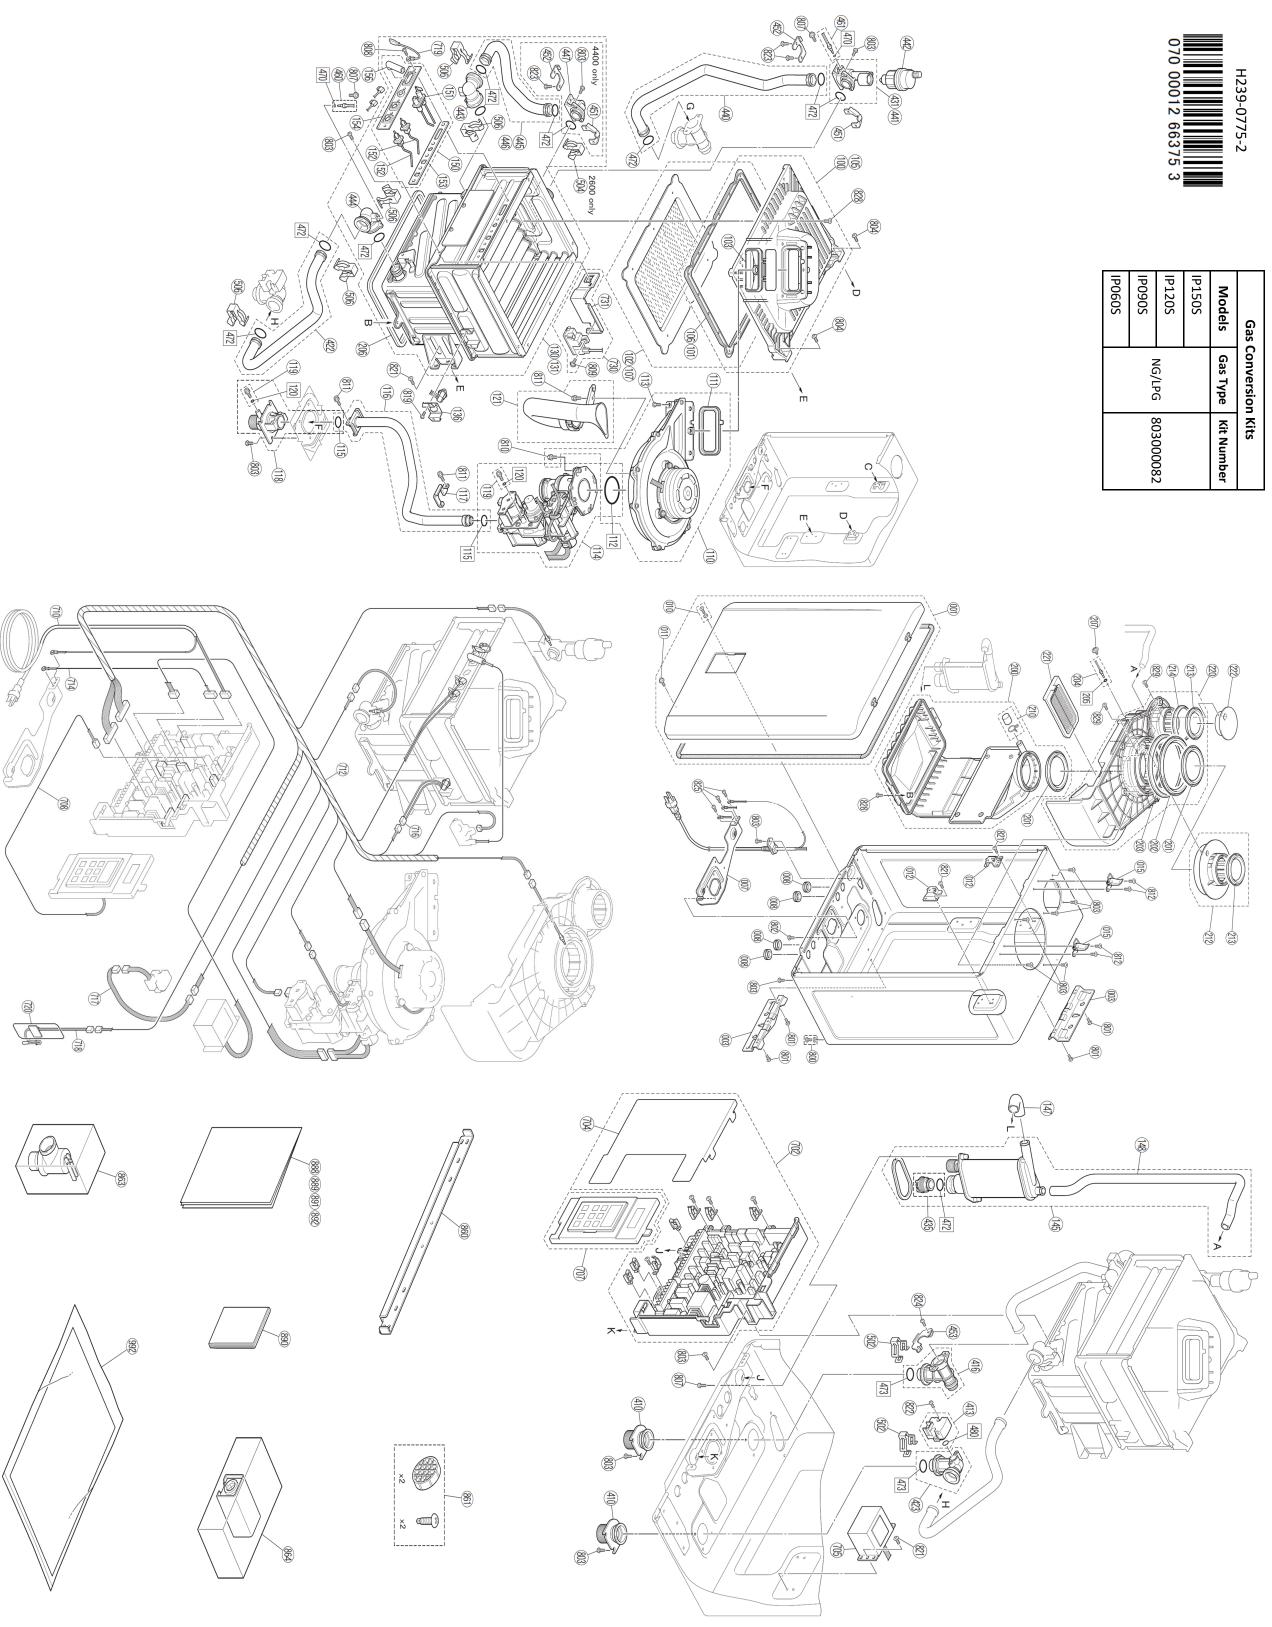

Ensure the LWCO device is working correctly.

Check the flame rod and wire for damage.

Close the gas shut off valve installed near the boiler. Ensure the flame rod and wire are not wet.
